

Phishing Awareness Training

Vissampalli Mahesh Babu

What is Phishing?

Phishing is a type of cyberattack where attackers trick you into giving up sensitive information — like passwords, OTPs, or bank details — by pretending to be someone trustworthy.

How Phishing Emails Work

- Sender looks legitimate (e.g., "support@paypal.com" instead of "paypal.com")
- Creates urgency: "Your account will be suspended in 24 hours"
- Contains a link asking you to "verify" or "confirm" your details
- May include attachments with malware

How to Spot a Fake Website

- Check the URL carefully for misspellings (e.g., "amaz0n.com")
- Look for HTTPS and the padlock icon — but note padlock alone doesn't guarantee safety
- Poor design, broken images, or grammar mistakes are red flags
- Hover over links before clicking to see the real destination URL

Social Engineering Tactics

- Pretexting: attacker pretends to be IT support, a bank, or your boss
- Urgency/Fear: "Act now or lose access"
- Authority: impersonating a senior figure to pressure quick action
- Baiting: offering something enticing (prize, free gift) to get you to click

Example 1:

"Notice the mismatched sender domain and urgent tone."

Example 2:

"Notice the suspicious link and spelling errors."

Best Practices Checklist

- Never share passwords or OTPs over email or phone
- Verify the sender before clicking any link
- Hover over links to check the real URL
- Use multi-factor authentication (MFA) wherever possible
- Report suspicious emails to your IT/security team

Quiz: Is This Real or Fake?

Question: "Is this email legitimate or a phishing attempt? Why?"

Quiz Answer:

This is a phishing email because: [explain — e.g., "the sender domain is misspelled and it creates false urgency"]

Summary:

Key Takeaway: Always pause before clicking. When in doubt, verify directly with the source.

Thank you!
